Hi Hekim & Phillip,

Thanks for sending this over and for thinking of CCI for it. There's a lot here we like.

The problem is overlap with recent coverage. We've published several pieces in the past couple of months on [AI-generated records](#), the gap between [what a file says and what it can prove](#), ISO 42001/NIST as scaffolding rather than safe harbor and [Moblely v. Workday](#), specifically.

What we haven't seen as much of is the employment-discrimination frame you're working in — pretext, burden-shifting and what happens when AI-drafted records get read side by side across a workforce. If the piece focused on that, we'd be happy to consider a revision.

If you do decide you want to revise and resubmit, I would recommend reading those examples I mentioned earlier, but we completely understand if you'd prefer to pitch this elsewhere.

Cheers,
Jennifer

Subject: Article Submission: The Evidentiary Deficit in AI-Assisted Record-Keeping
To: <editor@corporatecomplianceinsights.com>

Dear CCI Editorial Team,

We are pleased to submit for consideration our article, "The Evidentiary Deficit in AI-Assisted Record-Keeping."

The article examines a documentation and governance problem arising in AI-assisted workflows: a record can read as complete and authoritative while losing the evidentiary trail needed to reconstruct how a consequential decision was reached.

The article introduces Decision Reconstruction Risk (DRR) as a way of describing this failure mode. It examines the implications for compliance, investigations, HR, legal review, regulatory scrutiny, and organizational accountability, and considers practical controls for preserving the evidence, human judgment, and decision trail behind consequential records.

The article also presents the Justification Review Standard (JRS) as an operational example of how this problem can be addressed within existing HR, compliance, investigation, audit, and legal workflows. JRS is a developing framework and is currently undergoing structured validation. The manuscript does not present it as an established industry standard or as a completed validation.

The authors are:

Hekim Colpan is an AI Governance and Compliance Manager, Data Protection Manager, and ISO/IEC 42001 auditor based in Germany. His work focuses on the operational implementation of AI management systems, the EU AI Act, GDPR accountability, DORA, and governance controls for AI-assisted systems.

Phillip Wikes is an AI Governance and Cognitive Risk Advisor focused on documentation integrity, evidentiary traceability, and record-level controls in AI-assisted environments. He served as a Lead Civil Rights Officer with the Maryland Commission on Civil Rights and developed the Justification Review Standard and the Decision Reconstruction Risk concept. He holds an M.S. in Negotiation and Conflict Management.

The manuscript is attached for editorial consideration. We would be pleased to provide any additional author information, biographies, photographs, or other materials required for the contributor process.

Thank you for considering the submission. We would welcome the opportunity to contribute to Corporate Compliance Insights.

Sincerely,

Hekim Colpan
Phillip Wikes
